Preliminary comparative analysis of the corona during the 11 July 2010 total solar eclipse

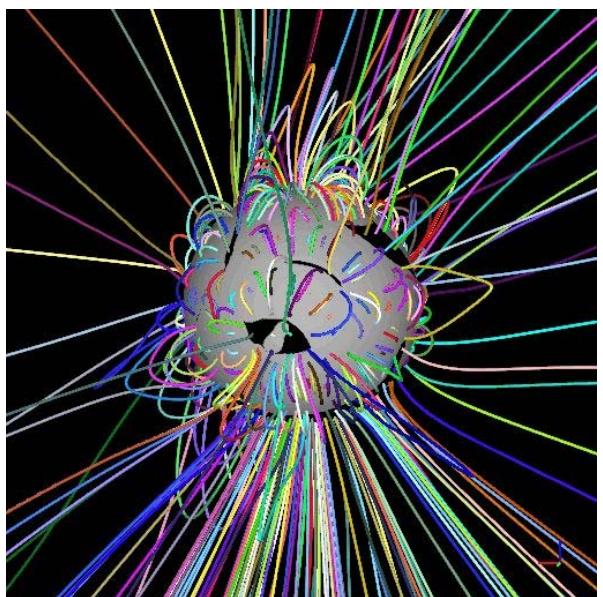

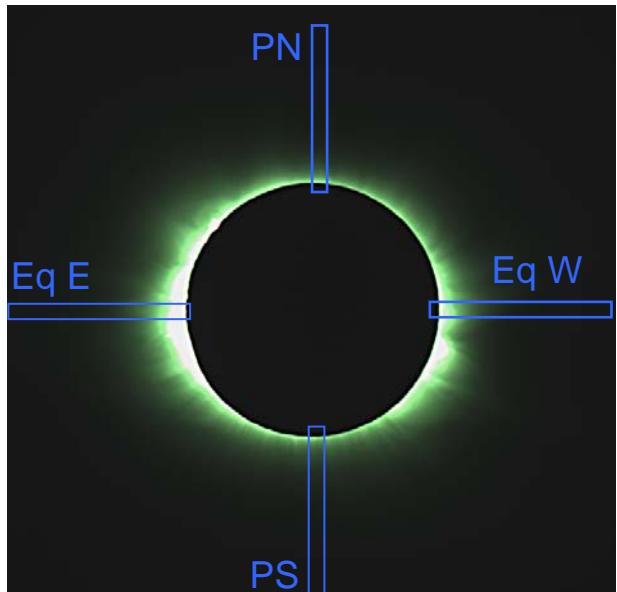

*White light image of the corona
from the total solar eclipse seen in Hao
French Polynesie
Superposition of the disc images in 171Å,
193Å from AIA/SDO*

Plot of the field lines in the 11 July 2010 K-corona

From the Predictive Science Modeling support
For Heliospheric and Magnetic Imager

Preliminary comparative analysis of the corona during the 20 March 2015 total solar eclipse

*Plot of the field lines (20 March 2015) from the code available at
http://www.predsci.com/hmi/field_lines_plot.php*

White light image of the corona in Svalbard in blue, location where the 20 Mm radial cut are taken, for performing the photometric analysis

Regions: 1.005<Rsol<2	11/07/2010 Eclipse Scale height Mm and temperature K	20/03/2015 Eclipse Scale height Mm and temperature
East	86 Mm (T = 1,693 MK)	57 Mm (T = 1,122 MK)
West	69 Mm (T = 1,358 MK)	103 Mm (T = 2,027 MK)
North	78 Mm (T = 1,535 MK)	61 Mm (T = 1,200 MK)
South	65 Mm (T = 1,279 MK)	71 Mm (T = 1,397 MK)

Comparison of the scale height showing a temperature dependance
