Supermodulation of the solar cycle

Observations

- Solar cycle modulation

3D direct numerical simulation

Conclusions

Results

- 1st evidence of supermodulation in 3D direct numerical simulations (chaotic alternance between amplitude modulation phases and parity modulation phases devoid of grand minima)
- reminiscent of the variations of the solar activity
 $\tau_{\text{wave}}^{\text{solar cycle}} (\sim 10 \text{ yr}) \ll \tau_{\text{amp. mod.}}^{\text{de Vries cycle}} (\sim 10^2 \text{ yr}) \ll \tau_{\text{super mod.}}^{\text{Hale cycle}} (\sim 10^3 \text{ yr})$
- parity interactions may govern the long term modulation of solar magnetic activity
