Photometric redshifts with Deep Learning

Photometric redshifts from SDSS images using a Convolutional Neural Network (J. Pasquet, E. Bertin, M. Treyer, S. Arnouts and D. Fouchez, just submitted)

Key elements:

- 1. A representative and a complete training database with r-band magnitude \leq 17.8 and redshift, $z\leq$ 0.4 (516,525 galaxies)
- 2. Photoz values + associated Probability Distribution Functions
- 3. Photoz immune to IQ variations and neighbours contamination
- 4. A dedicated Neural Network architecture

Results obtained:

Clear improvements compared to other methods!

Our results

Summary

Assess the prediction quality of our PDFs

The PIT statistic (Dawid 1984) is based on the histogram of the cumulative probabilities at the true value. For galaxy i with spectroscopic redshift z_i in the test sample :

$$PIT_{i} = \int_{-\infty}^{z_{i}} PDF_{i}(z) dz$$

Our results

Summan

Impact of the extinction of our Galaxy on photometric redshifts

Our method tends to overestimate redshifts in obscured regions (confusing galactic dust attenuation with redshift dimming), unless $E_{(B-V)}$ is used for training

Summan

Impact of the disk inclination of galaxies on photometric redshifts

Our method automatically corrects for galactic dust reddening which increases with disk inclination

Results
The data
DL netwo
Our result

- We developed a Deep Convolutional Neural Network (CNN) used as a classifier to estimate photometric redshifts and their associated PDFs.
- Our work shows significant improvements for:
 - the dispersion of photometric redshifts, σ_{MAD}
 - the PDFs that are well calibrated
 - no measurable bias with the reddening and the inclination of galaxies
- A high SNR tends to improve the results
- This work opens very promising perspectives for the exploitation of large and deep photometric surveys which encompass a larger redshift range and where spectroscopic follow-up is necessarily limited

Summary

Impact of the SNR on the performance

 σ_{MAD} decreases with the signal-to-noise ratio (SNR), achieving values below 0.007 for SNR > 100, as in the deep stacked region of Stripe 82
